TITLE: Introduction of gas cyanization of structural steel
in the State Machine building Plant at Kolarovgrad

PERIODICAL: Mashinostroene, no. 1, 1963, 12-18

TEXT: The experiments were carried out with round specimens made of medium-carbon alloy steel 40X (40Kh), in U-105 (Ts-105) furnaces at a temperature of 790-840°C. During the gas cyanization, petrol and liquid ammonia entering the furnace from different points were used as the active gas. The petrol was fed in by a dropper, while the consumption of ammonia was read on a rheometer charged with toluene. Best results with respect to the diffusion of carbon and nitrogen in the surface layer of the specimens were obtained by using an optimum quantity of 250-300 drops/min of petrol and 14 liters/min of ammonia. Under these conditions the layer attains its highest durability and stability, and a higher strength

Introduction of gas ...

of wear than when a liquid cyanization is applied. The duration of the process of saturation must not exceed 100-110 minutes, when the required layer of 0.25 mm thickness is obtained. This process cuts the time of liquid cyanization by 15-20%. During the optimum conditions of the process an ϵ -phase in the structure of the diffusion layer does not exist i.e. the strength of the specimens is higher, and the transition to the core is smoother. The fatigue limit of the specimens was 57.1 kg/mm². The effect of gas cyanization on the deformation of different machine parts was within the admissible limits. There are 12 figures and 6 tables.

TITLE: Electric distant-recording thermometers with a thermistor receiver

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 8, 1961, 9-10, abstract 8882
("Khidrol. i meteorologiya, 1960, no. 1, 3-11, Bulgarian: Russian
and English summary)

TEXT: An investigation was made of NiO, Mn_2O_3 , PbO and CuO thermistors of 0.4 to 0.7 mm in diameter with platinum electrodes of 0.1 mm in diameter. It was found that the thermistors were most unstable during the first days after their manufacture and that only 6 months later they were suitable for measurements. However, even after one year, the non-stability of thermistors is preserved to a certain degree, probably, on account of the surface conductivity caused by air moisture. The non-stability decreases if the thermistor is covered with insulation varnish about 0.1 mm thick. Thermistors of the same material have similar calibration curves shifted in respect to each other. The coefficients of inertia of the thermistors investigated are within a range of 0.8 to 1.2 sec during a calm. It was found, experimentally and theoretically, that the spheric

Electric distant-recording thermometers ...

thermistors investigated are heated by 0.1°C above the temperature of the surrounding air at a feed voltage of 1 to 3 mwatt/cm², and that the heat flow produced through the communicating conductors (0.1 mm in diameter and 5 mm length) is approximately twice as high as that obtained through convective turbulent exchange. To obtain a linear temperature scale depending on the resistance, 2 methods were developed. In the first method linearization within 30 - 40°C of the scale is obtained with the aid of a resistance; and by the second method - within 100 - 120°C on the scale - with the aid of a logarithmic amplifier. In the resulting tables the non-linearity of the scale is expressed by the percentage of sensitivity at the ends of the given scale section relative to that in the middle of the scale. Compound systems are also given to obtain maximum sensitivity of measurements at a definite maximum permissible heat diffusion in the measuring circuit. ix

TITLE: Wind profile in the near-ground layer of the atmosphere, in the presence of unstable equilibrium

PERIODICAL: Referativnyi zhurnal, Mekhanika, no. 4, 1963, 109, abstract 4B722 (Dokl. Bolg. AN, v. 15, no. 1, 1962, 21-24)

TEXT: This article presents a generalization of Prandtl's theory for the case of unstable stratification of the near-ground layer of air. Substituting

$w' = w'_M + w'_T$, $\ell = \ell_M + \ell_T$, where w'_M and w'_T are the components of the mechanical and

thermal pulsations of the vertical velocity, respectively, while ℓ_M and ℓ_T are

the instantaneous displacement paths resulting from the mechanical and thermal pulsations; and assuming these quantities to be independent of each other, the authors arrive at

$$\frac{d\bar{u}}{dz} = \frac{v_*}{kz} \frac{k_M}{k_M + k_T}$$

Here, \bar{u} is the average velocity at height z , v_* is the dynamic velocity, k is

Card 1/2

L 16738-63

Wind profile in

S/124/63/000/004/026/064

Karman's constant, k_M is the mechanical turbulence factor, k_T is the thermal turbulence factor.

$$\phi = \frac{k_M}{k_M + k_T}$$

is the correction to the logarithmic wind law for instability, the so-called universal function. In addition, a form of the universal function depending upon Richardson's number is found:

$$1 + \frac{2}{\sqrt{1 + 2^{1/2} \lambda^2 (-Ri)^{1/2}}}$$

where λ is an empirical parameter.

Whatever the equilibrium ($Ri < 0$) the wind profile in the near-ground level is logarithmic. With instability ($Ri > 0$) ϕ falls off and the gradient of the average wind becomes less.

In conclusion the authors compare the results of the computations of the vertical wind profile in the near-ground layer with data from other authors. There is a bibliography of 12 items. E. A. Burman.

TITLE: Influence of the transitional zone on the diffusion in the surface layer during nonstationary stratification

SOURCE: Bulgarska akademiya na naukite. Doklady, v. 19, no. 1, 1966, 29-31

TOPIC TAGS: atmospheric stratification, atmospheric diffusion, applied mathematics

ABSTRACT: Using the modern representation of the surface layer adjacent to the ground (A. S. Monin, A. M. Obukhov, Tr. Geofiz. In-ta, 1954, No 24, 151), the author investigated theoretically the diffusion in the vertical direction within the framework of the two-layer theory assuming that the transition between the dynamical and thermal sub-layer is a sudden one. The calculation is based on the semi-empirical diffusion equation for an infinite linear source oriented at right angle to the wind. The results are in agreement with the data due to Kramer (see p. 154 of F. Pasquill, Atmospheric Diffusion, Van Nostr. Co., 1962). This paper was presented by Academician L. Krystanov on 5 Oct. 1965.  TITLE: Diffusion from a point source in near-ground air layers during nonstationary stratification
 SOURCE: Bulgarska akademiya na naukite, v. 18, no. 2, 1965, 109-112
 TOPIC TAGS: surface boundary layer, atmospheric diffusion, atmospheric stratification 12,44,55
 ABSTRACT: [Russian article] The author studied earlier, in the form of a two-layer problem (Compt. rend. Acad. bulg. Sci., 17, 1964, No 12, 1087), the diffusion in near-ground air layers during nonstationary stratification. The result corresponding to an instantaneous infinite plane source located at an altitude z parallel to the earth's surface has obviously a limited practical significance. In the present paper, using the semiempirical diffusion equation (taking into account the vertical turbulent exchange) the author studies the important case of diffusion from a point source. The diffusion in the wind direction is not taken into account. The results of the calculations seem to explain well the experimental data obtained by Oramer (see F. Pasquill, Atmospheric Diffusion, Van Nostr. Co., 1962, p. 154).

Title : Xantogenates as Stimulators of the Growth of
Some Farm Crops

Orig Pub : Dokl. AN SSSR, 1956, 111, No 2, 478-479.

Abstract : Seeds of wheat, rye, and clover were treated with alkaline xantogenates in concentrations of 1:5000 and 1:50000 for periods of 1-3 hours. The xantogenates acted as stimulators of the growth of the roots. The greatest increase in the growth of the roots was noted (by 225% as compared with control) in rape. The accumulation of dry matter at the end of the period of vegetation was greater in the experimental plants than in the control.

Title : The Significance of Conditions of Aerial Nourishment and Growth for the Development of Plants.

Orig Pub : Fiziol. rasteniy, 1957, 4, No 1, 52-59

Abstract : For 20 or 27 days after the appearance of shoots Bulgarian winter wheats, Nos. 14 and 301, were exposed to 9-, 8-, 7-, and 6-hour days, thus promoting the pre-vernalization of the plants. When this was done over longer periods with shorter days, the effect was heightened. The author attributes this speeding up of development to improvement of the growth point of the central shoot, resulting from the limited development of the side shoots. But

J. Iordanov, S. Tarylov, I. Georgiev, and R. Beleva-Staykova

4

Med

C. R. Acad. Sci. U.R.S.S., 1956, 106, 1037—1060 (I. P. Pavlov
Higher Med. Inst., Plovdiv, Bulgaria).—Slices of frozen gelatin
containing blood were treated with Groux and Leblanc reagents to
determine the ascorbic acid content in the blood. In human blood,
platelets and leucocytes contained most of the ascorbic acid.
Chicken embryo blood contained high concn. of ascorbic acid but in
adult hens (and frogs) a positive reaction was obtained in some
cases only after previous intravenous injection of ascorbic acid.
Narcosis tends to decrease the ascorbic acid content in plasma and
in the red layer of centrifuged blood. Stimulants (caffeine) tend
to increase it. (Russian)

AUTHOR: Yordanov, Khr.

TITLE: On the use of the hypochlorite method for processing molybdenum concentrates

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 4, 1962, 21, abstract 4G127 ("Minno delo i metalurgiya", 1961, v. 16, no. 9, 25-27, Bulgarian; Russian and German summary)

TEXT: As a result of laboratory investigations it was established that the hypochlorite method can be used for processing molybdenum concentrates. The optimum conditions are as follows: NaClO concentration 30 g/l; temperature 20°C; duration of the process - 3 hours. There are 8 references.
